HUMAN CAPITAL, SCHOOLS, AND ECONOMIC GROWTH

Eric A. Hanushek
Stanford University

Pareto Lecture
Collegio Carlo Alberto
Overview

• The long run importance of human capital
  • Substantial new evidence
  • Quality imperative
  • Magnitudes

• Skepticism about cross-country growth models
  • Specification
  • Causality
  • Form of relationship

• Evidence on Policy Options
  • Integrate new understanding of schools

Cognitive Skills and Long Run Economic Growth
Education in Growth (Theory)

1. Augmented neoclassical growth theories
   • Mankiw/Romer/Weil (QJE 1992)

2. Theories of endogenous growth
   • Lucas (JMonE 1988); Romer (JPE 1990); Aghion/Howitt (1998)

3. Theories of knowledge diffusion
   • Nelson/Phelps (AER 1966); Benhabib/Spiegel (HbEcoGro 2005)
Empirical Progression – Measure of Human Capital

- Simple cross-country growth regressions
  - Enrollment rates (Barro QJE 1991)
- Wide variety of measurement alternatives
  - School enrollment and attainment (Mankiw/Romer/Weil QJE 1992; Levine/Renelt AER 1992; Barro/Lee JMonE 1993)

Jacob Mincer + expediency
A Simple Growth Model with Cognitive Skills

\[ g = \gamma H + \beta X + \varepsilon \]

\[ g = \gamma S + \beta X + \varepsilon \]
Years of Schooling and Economic Growth

Added-variable plots of a regression of the average annual rate of growth (in percent) of real GDP per capita in 1960-2000 on average years of schooling in 1960 and the initial level of real GDP per capita in 1960.

coeff = 0.581, se = 0.095, t = 6.10

Added-variable plots of a regression of the average annual rate of growth (in percent) of real GDP per capita in 1960-2000 on average years of schooling in 1960 and the initial level of real GDP per capita in 1960.
A Simple Growth Model with Cognitive Skills

\[ g = \gamma H + \beta X + \varepsilon \]

\[ H = \lambda F + \phi(qS) + \eta A + \alpha Z + \nu \]
Empirical Progression

• Simple cross-country growth regressions
  • Enrollment rates (Barro QJE 1991)

• Wide variety of measurement alternatives
  • School enrollment and attainment (Mankiw/Romer/Weil QJE 1992; Levine/Renelt AER 1992; Barro/Lee JMonE 1993)

• Cognitive skills
  • Hanushek/Kimko (AER 2000); Barro (AER 2001); Woessmann (JESur 2003); Coulombe/Tremblay (TopMac 2006); Ciccone/Papaioannou (RES 2009)
  • Hanushek/Woessmann (JEL 2008, J Econ Growth 2012)
International Student Achievement Tests

• Measuring knowledge, not sitting in the classroom

• International agencies have conducted many international tests of students’ performance in cognitive skills since mid-1960s
  • 12 testing occasions, 36 separate test observations (age levels, subjects)

• Combine into single measure of human capital

PISA Mathematics Achievement, 2009

The graph shows the PISA Mathematics Achievement scores for various countries and regions. The x-axis lists countries and regions, while the y-axis represents the achievement scores ranging from 0 to 600. Each country or region is represented by a bar, with the height indicating the achievement score.

Notable countries and regions include Shanghai, Singapore, Hong Kong, Korea, Taiwan, Finland, Liechtenstein, Switzerland, Japan, Canada, Netherlands, New Zealand, Belgium, Germany, Estonia, Iceland, Denmark, Norway, France, and Shanghai (China). The scores vary widely, with some countries achieving exceptional results.
PISA Mathematics Achievement, 2009
Projecting the Benefits of Reform

- School reform takes time (assumed 20 years)
- Improved schools take time to impact average skills of workers (2.5% replaced each year)
- Growth without improvement at 1.5%
- Present value of reform bonus discounted at 3%
- Calculated for lifetime of person born today

Notes: Dependent variable: average annual growth rate in GDP per capita, 1960-2000. Regressions include a constant. Test scores are average of math and science, primary through end of secondary school, all years. \(t\)-statistics in parentheses.

- Measure of years of schooling refers to the average between 1960 and 2000.
- Robust regression including two outliers (using `rreg` robust estimation command implemented in Stata).
- Specification includes dummies for the eight world regions depicted in Figure 1.
- Specification includes additional controls for openness and property rights.
- Specification includes additional controls for openness, property rights, fertility, and tropical location.

Notes: Reported numbers are the coefficient on test scores in each model specification. Dependent variable: Unless noted otherwise, average annual growth rate in GDP per capita, 1960-2000. Control variables: Initial GDP per capita, initial years of schooling, and a constant. Test scores: Unless noted otherwise, average of math and science, primary through end of secondary school, all years. t-statistics in parentheses.

- Countries above/below sample median of GDP per capita 1960.
- Test scores refer only to tests performed until 1984.
- Countries with largest (outliers)/smallest (core) residuals when regressing years of schooling on test scores.
Causality

• Years of schooling: Bils and Klenow (AER 2000)

1. IV Models
   • Variations in cognitive skills driven by institutional characteristics of the school systems (central exams, private schooling, teacher salaries, Catholic schools, autonomy)
   • IV rules out that simple reverse causality or that test scores just reflect family background

2. DiD Model I
   • Changes in test scores and changes in growth paths
   • Eliminating level effects which may be interrelated with country-specific institutions and cultures
Trends in Test Scores

Depiction based on PISA 2000 performance and a backward induction based on the coefficient on a time variable from a regression of all available international test scores (by year, age group, and subject) on the time variable and dummies for age group and subject.
Trends in Growth Rates vs. Trends in Test Scores

Scatter plot of trend in annual growth rate of GDP per capita from 1975 to 2000 against trend in test scores.
Causality

- Years of schooling: Bils and Klenow (AER 2000)

1. IV Models
   - Variations in cognitive skills driven by institutional characteristics of the school systems
   - IV rules out that, e.g., test scores just reflect family background

2. DiD Model I
   - Changes in test scores and changes in growth paths
   - Eliminating level effects which may be interrelated with country-specific institutions and cultures

3. DiD Model II
   - Comparing the impacts of U.S. and home-country education of immigrants on the U.S. labor market
   - DiD rules out that test scores simply reflect cultural factors or economic institutions of home country

\[ \ln y_{ic} = \alpha_0 + \alpha_1 S_{ic} + \alpha_2 PE_{ic} + \alpha_3 PE_{ic}^2 + \gamma_y H_{ic} + \nu_{ic} \]

\[ \ln y_{ic} = \alpha_0 + \alpha_1 S_{ic} + \alpha_2 PE_{ic} + \alpha_3 PE_{ic}^2 + [\alpha_4 ORIGIN_i + \delta T_c + \delta_O (T_c \times ORIGIN_i)] + \nu_{ic} \]

Notes: Dependent variable: log(annual earnings). Cognitive skills refers to average test score of country of origin (centered at zero). Sample: All immigrants identified by country of birth not in school whose age is greater than 25, who are employed, and who earned more than $1,000 in 1999. Immigrants who had obtained some but not all of their education in the U.S. were excluded from the sample. Immigrants from all countries of origin for which there are cognitive-skill scores, except for the following countries (areas) which could not be identified because of census restrictions on release of data for small cells: Swaziland, Slovenia, Macau-China, Luxembourg, Liechtenstein, Estonia, Botswana, Bahrain, Tunisia, and Iceland. Israel could not be identified separately from Palestine; both were assigned the Israeli score. Robust absolute values of \(t\)-statistics in parentheses with clustering by country of origin. Source: Authors' calculations from 2000 Census IPUMS data.

a. U.S. educated immigrants are identified as immigrating to the U.S. before the beginning year of schooling.
b. Immigrants educated in their country of origin are identified as immigrating to the U.S. after the final year of schooling.
c. The economic growth sample relies on the data for immigrants from the 50 countries in the basic growth regressions.
Conclusion on Growth Estimates

- Strong and robust impact of cognitive skills
- Difficult to determine causality
- Series of alternative approaches
  - Each inconclusive by itself
  - Jointly provide considerable evidence of causal effect
Are there things to be done?
Resource Policies

• Little evidence of success
  • Cross country evidence
  • Within country – developed
  • Within country – developing
Resources and Performance across Countries

Math performance in PISA 2003

Cumulative educational expenditure per student

$R^2 = 0.01$

$R^2 = 0.15$
Resource Policies

• Little evidence of success
  • Cross country evidence
  • Within country – developed
  • Within country – developing

• Consistent with detailed analysis
  • class size
  • school characteristics
Resource Policies

- Does not say “resources never have effect”
- Does not say “resources cannot have effect”

*No expectation within current incentive structure*
Teacher Quality

- Teachers most important input
- No identifiable characteristics
  - Master’s degrees
  - Experience*
  - Certification
  - Preparation
  - Professional development
- Observable through both student performance and supervisor ratings
- Cannot regulate and pay on characteristics
Institutional Reforms Supported by Evidence

• Centralized exams
• Accountability
• Autonomy/decentralization
• Choice
• Direct performance incentives
Alternative Estimates of Least Effective Teachers (United States distribution)
Conclusions

• Gains very large from better teachers
• Difference between effective and ineffective enormous
• Gains justify substantial structural change

Cautions

• Gains only with achievement
• Gains take long time
• “too hard” willing to accept large loss
